

Climatic Problems

In recent years, we have been facing a big problem, climate changes. Human activities have led to changes of atmosphere composition, making our earth warmer and causing extreme weather. Since the past century, Hong Kong and other countries have faced a warming weather in the cold season. What can be done to deal with these climate problems?

First and foremost, Hong Kong government should be a leader to lead and implement effective carbon reduction policies such as setting up a number of emission reduction targets e.g. a 10% reduction in carbon emissions yearly and give punishment or praise to enterprises for failing or being able to keep our air clean. In addition, they need to educate the public to know what climate changes are. The government really needs to be a leader to implement a thorough plan to improve our environment immediately.

Moreover, Hong Kong government can advocate using cleaner fuels and renewable energy. Actually, we can try using wind and solar energy instead of burning fossil fuels. This can protect our environment since using fossil fuels like coal, oil and natural gas will cause many pollution problems. In contrast, renewable energy sources do not have such a harmful effect. Thus, we should use them to benefit ourselves.

Furthermore, businessmen should take the most important responsibility of climate changes because their factories keep releasing polluted gases into the atmosphere. Meanwhile, businessmen really need to reduce greenhouse gas emissions. Business firms can have a research on introducing technological innovations to their workplace to cut carbon emissions. In addition, employers can educate employees to uphold the principle of environmental protection in their workplace.

Finding ways to solve the problem of global warming is not only the responsibility of our government and businessmen, but also everyone on earth. We need to have the habits of saving energy in our daily life. We should switch off electrical appliances when we don't need to use them. Also, people should buy less polluting cars because the gas emitted by vehicles is harmful to our environment. Citizens can grow more trees or plants, which will beautify our environment and bring us fresh air.

In conclusion, everyone has the responsibility to help solve the problem of climate changes. If we don't take action and reduce greenhouse gases emissions, our beautiful home, the earth, will die soon.
